

Parameters after Snowmass

- Tweaking the parameters is anyway needed due to
 - small change of nominal gradient to 30 to 31.5MV/m
 - change of RF unit configuration (which must be consistent with 35MV/m)

This can be done soon.

- However, more important is **whether Low Q set can be retained.**
 - 6km e^- DR and $2 \times$ 6km e^+ DR do not guarantee ~ 6000 bunches
 - Bunch compressor might be smaller if $\sigma_z = 150\mu\text{m}$ is not required.
- This is still an open question.
